

The AI company manager that sleeps on it

It ran a 10-person startup for a full quarter on a **~400-token working memory** — because it **forgets on purpose**, tests its own forgetting with three delayed copies of itself, and restores the **exact fact** when a decision would change.

The innovation — a layered agent that forgets on purpose, and proves it

Four tools, four load-bearing jobs

Liquid
LFM-2.5 · 2.6B

Every brain. All six agent roles think with one tiny model, via API — **\$0 total**. Long horizons need architecture, not giant models.

Tinybird
Rawtree

The memory. Every event appended forever. The manager runs **SQL over its own past** — and lost facts are restored from here.

Nimble

The outside world. "Our vendor slipped" → the agent researches alternatives on the **live web** before replanning.

Black Forest Labs
FLUX 3

The Monday briefing. The weekly plan becomes a 10-second **voiced video** for the team.

Live demo: pick any teammate on the week board, type "our provider got delayed" — watch it recall (Rawtree), research (Nimble), reply and reshuffle the week. Every thought is Liquid.
